Experience

Co-Founder & CTO, BrainReef Aug 2025 – Nov 2026
TypeScript monorepo, four production surfaces, 10,000+ users *Bengaluru, India*

- Own the architecture end to end: Next.js and Node services, an 84-table Postgres schema behind Prisma, Cloudflare Workers and Durable Objects for the realtime path, R2 for storage. About 1,300 of my commits, plus pricing, billing and the production infrastructure.
- Designed the **billing ledger** as append-only signed entries, with debit, refund and admin top-up made exactly-once by a composite unique constraint rather than application checks. Duplicate writes resolve through a P2002 caught outside the transaction, never inside it, where the swallowed error would poison an already-aborted Postgres transaction.
- Built the Razorpay path so it survives the buyer closing the tab: HMAC verified over the raw body, activation idempotent on the order id, an uncaught throw returning 500 so the provider retries, and a deliberate 200 on orders that are not ours so it stops.
- Own the multi-tenant seam and the status state machines behind drives and interview sessions. A scoped Prisma client narrows every row to the caller's org, deliberately unscoped reads are documented in-file with the access they proved, and unauthorized reads answer 404 rather than 403 so the API resists enumeration.
- Led the reliability and scaling pass that made app instances fungible: rate-limit counters moved from process memory to Redis, PM2 cluster mode with a bounded Prisma pool, PgBouncer in transaction mode with prepared statements off, nginx keepalive upstreams. Public GETs went to a stale-while-revalidate edge cache, with caching skipped on unbounded query keys.
- Set the standards the other five contributors build against: 28 architecture decision records, guard patterns every API route exports through, and review on anything touching tenancy or money.
- Removed the quadratic and racy paths behind those numbers: a covering index for the contest leaderboard, an aggregate replacing a full pull of every prior submission blob, and one atomic UPDATE with in-SQL dedup replacing a three-query read-modify-write. Observability is Sentry plus structured request logging with correlation ids, which is how incidents get triaged.

Founding Engineer, Fuleex Technologies Oct 2025 – Sep 2026
dexichat.com, multi-tenant messaging and voice platform *Remote*

- 300+ commits on a live Node platform paying businesses run customer conversations on across WhatsApp, Instagram, web chat, SMS and phone. 95 tables, 190+ migrations, Stripe and PayPlus on the money path.
- Fixed a duplicate-delivery bug that was reaching real customers: scheduled sends read rows and marked them only after the send returned, so two overlapping cron runs, or two PM2 instances, both claimed the same pending row. Claims are now atomic through a conditional updateMany that skips on a zero count.
- The reminder-call crons now set the sent flag before dialing and release it only if nothing was dialed. That is the partial-failure case stated explicitly: on an exception the flag is left set on purpose, because after a dial attempt an error cannot tell you whether the customer was reached, and calling someone twice is worse than missing one reminder.
- Ran a full security review of the codebase, wrote up **191 findings** and fixed the critical ones: handlers serving whichever tenant the URL named instead of the authenticated one, unauthenticated routes, impersonation logins overwriting the admin session, SSRF and prototype pollution, and two live Google service-account keys in git history.
- Built the phone agent on LiveKit, wiring streaming speech-to-text into an LLM into streaming text-to-speech, with per-connection state released on disconnect so a dropped socket leaks nothing.

Freelance Security Engineer, Upwork Oct 2024 – Nov 2025
Independent client engagements *Remote*

- Black-box and white-box penetration testing, OSINT and digital forensics for individual and enterprise clients. Where the habit of assuming the hostile input and the partial failure comes from.

Technical Skills

Backend: TypeScript / Node.js, Next.js route handlers, Fastify, Prisma, PostgreSQL, Redis, WebSockets, Zod validation at every trust boundary, REST and webhook integrations
Reliability & correctness: data integrity and consistency, append-only ledgers, idempotency keys, unique-constraint concurrency control, transaction scoping, atomic claim patterns for workers, state machines, retries, timeouts, partial failures and recovery, schema, data model and migration design, indexing and query-plan work, multi-tenant row isolation
Infrastructure & operations: Cloudflare Workers, Durable Objects and R2, PM2 cluster, nginx, PgBouncer, Docker, GitHub Actions. Observability and monitoring with Sentry and structured logging, incident response, staging and production runbooks, code standards and review
Frontend: React 19, Next.js App Router, Tailwind, React Hook Form · **Payments:** Razorpay orders and webhooks, Stripe, PayPlus
Security: penetration testing, threat modelling, operational risk, OSINT. TryHackMe Jr Penetration Tester, ISC2 Certified in Cybersecurity, HTB CPTS in progress

Education

NMAM Institute of Technology, Karkala, India. *B.E., Information Science & Engineering* July 2022 – June 2026
